

Neil Francis Gabisay

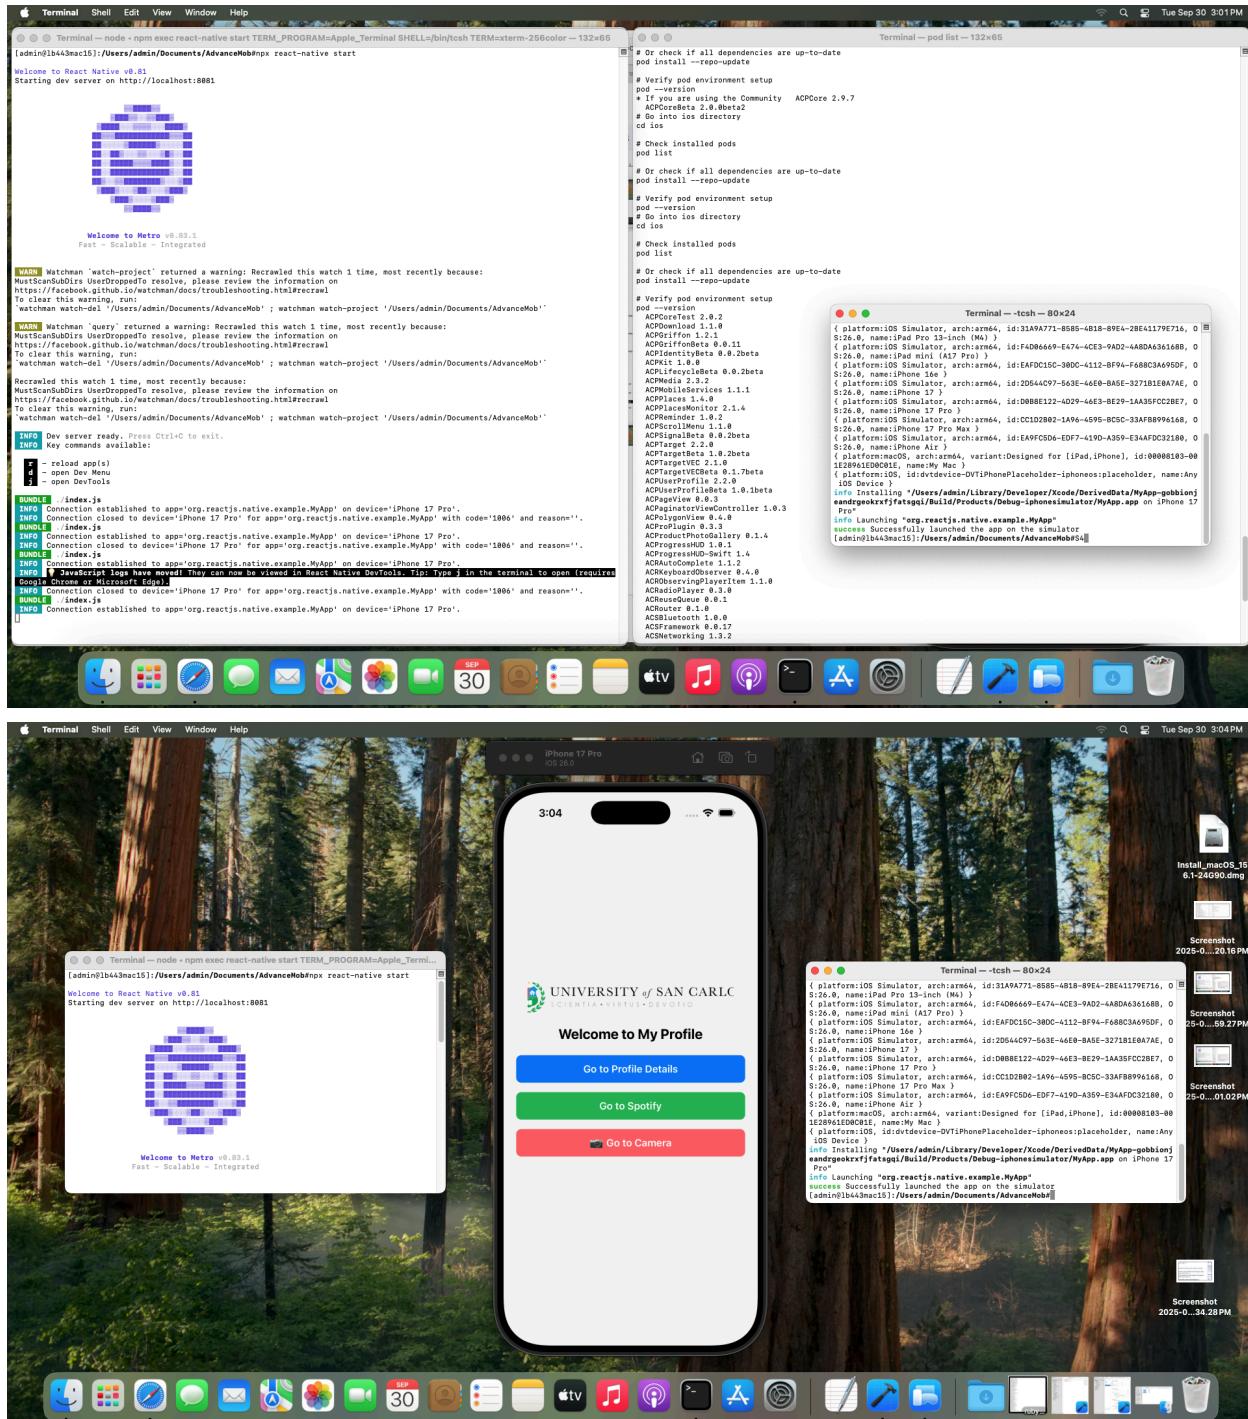

Week 6 Activity 1

IT5103N Group 1
TTH 12:30-3:00

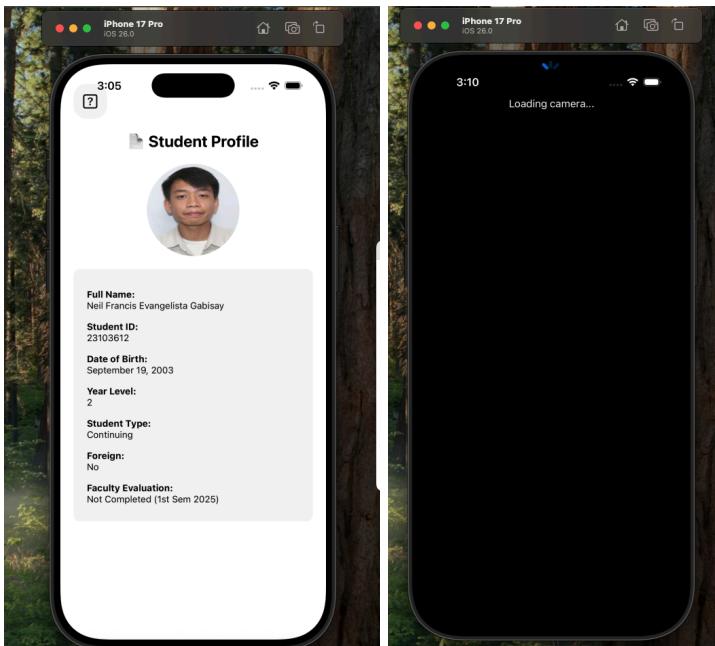

The project was opened in Visual Studio Code and Xcode, where the bundle identifier, deployment target, app details, and iPhone simulator. Using Terminal, npx react-native start and

npx pod-install were run to start the Metro bundler and link CocoaPods dependencies, after which the app was successfully launched and tested on the iOS simulator.

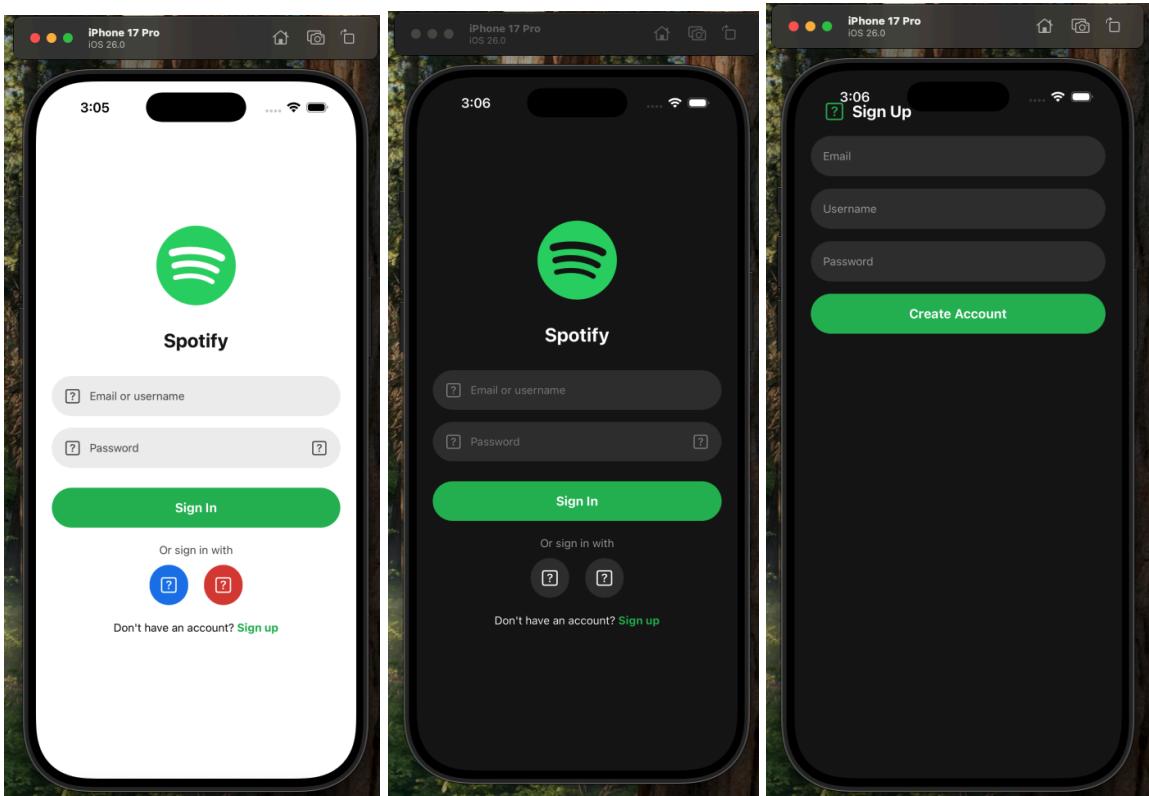

The simulator successfully launched the application, showing the main profile interface. This confirms that the app runs properly on iOS devices, with all dependencies installed and connected without errors.
